Files you change often and understand least

Low comprehension only matters where the code moves. Ranked by edit frequency over the last 90 days weighted against your comprehension estimate.

session.ts

412 lines · TypeScript · 31 edits in 90 days

Unreviewed

0 of 412 lines ever shown to you

THE RECORD

- Auto-accept was on for all 6 sessions that edited this file, so no diff was ever shown to you.
- 412 of 412 surviving lines are in the Unreviewed state.
- No commit touching this file was authored outside an agent session.
- 31 edits in 90 days, which puts it first on the risk list.
- Last agent session: 23 Sep. Last state change: none.

Coverage counts whether an edit was shown to you, not whether you read it. Never tested.

UNREVIEWED SYMBOLS

7 of 7

```
118 export async function rotateSession(sid: string) {
119   const prev = await store.get(sid)
120   if (!prev || prev.revokedAt) return null
121
122   const next = mintSession({
123     user: prev.user,
124     ttl: prev.ttl - drift(prev.issuedAt),
125   })
126
127   await store.put(next.id, next)
128   await store.revoke(sid, { grace: 30 })
129   return next
130 }
```

SESSION.TS · LINES 112-136

```
112  const GRACE_SECONDS = 30
113
114  function drift(issuedAt: number) {
115    return Math.max(0, Date.now() - issuedAt) / 1000
116  }
117
118  export async function rotateSession(sid: string) {
119    const prev = await store.get(sid)
120    if (!prev || prev.revokedAt) return null
121
122    const next = mintSession({
123      user: prev.user,
124      ttl: prev.ttl - drift(prev.issuedAt),
125    })
126
127    await store.put(next.id, next)
128    await store.revoke(sid, { grace: GRACE_SECONDS })
129    return next
130  }
```

QUESTION

The grace period on line 128 lets the old session keep working for 30 seconds after rotation. What breaks if it is removed?

- A Sessions leak because the old record is never deleted
- B In-flight requests carrying the old token fail during the rotation window
- C The TTL drift calculation on line 124 overflows
- D Nothing, it is defensive only

blind solid

Color scheme & type

Six discrete states, not a continuous score. They are ordered, so lightness falls monotonically from Unreviewed to Verified and carries the meaning on its own in grayscale or with color blindness. Hue shifts warm to cool as a second cue. Hatching marks anything never tested.

STATE SCALE

Unreviewed auto-accept #E8703A	Seen approved #A8602A	Stale changed since #5E5B48	Authored you wrote it #38505A	Verified quiz passed #27333A	Inherited not yours #2A2F36
---	--	--	--	---	--

SURFACES & TEXT

	#0C0E11	App ground
	#0F1215	Sidebar, panels
	#0A0C0E	Code wells, inset surfaces
	#1C2127	Buttons, active chips
	#242A31	Structural borders
	#E4E8EC	Primary text
	#959DA6	Secondary text, prose
	#666E78	Labels, metadata
	#6FA8D6	Links and selection, the only chrome accent

TYPE

38%

IBM Plex Mono · all numbers, code, filenames, labels

Files you change often and understand least.

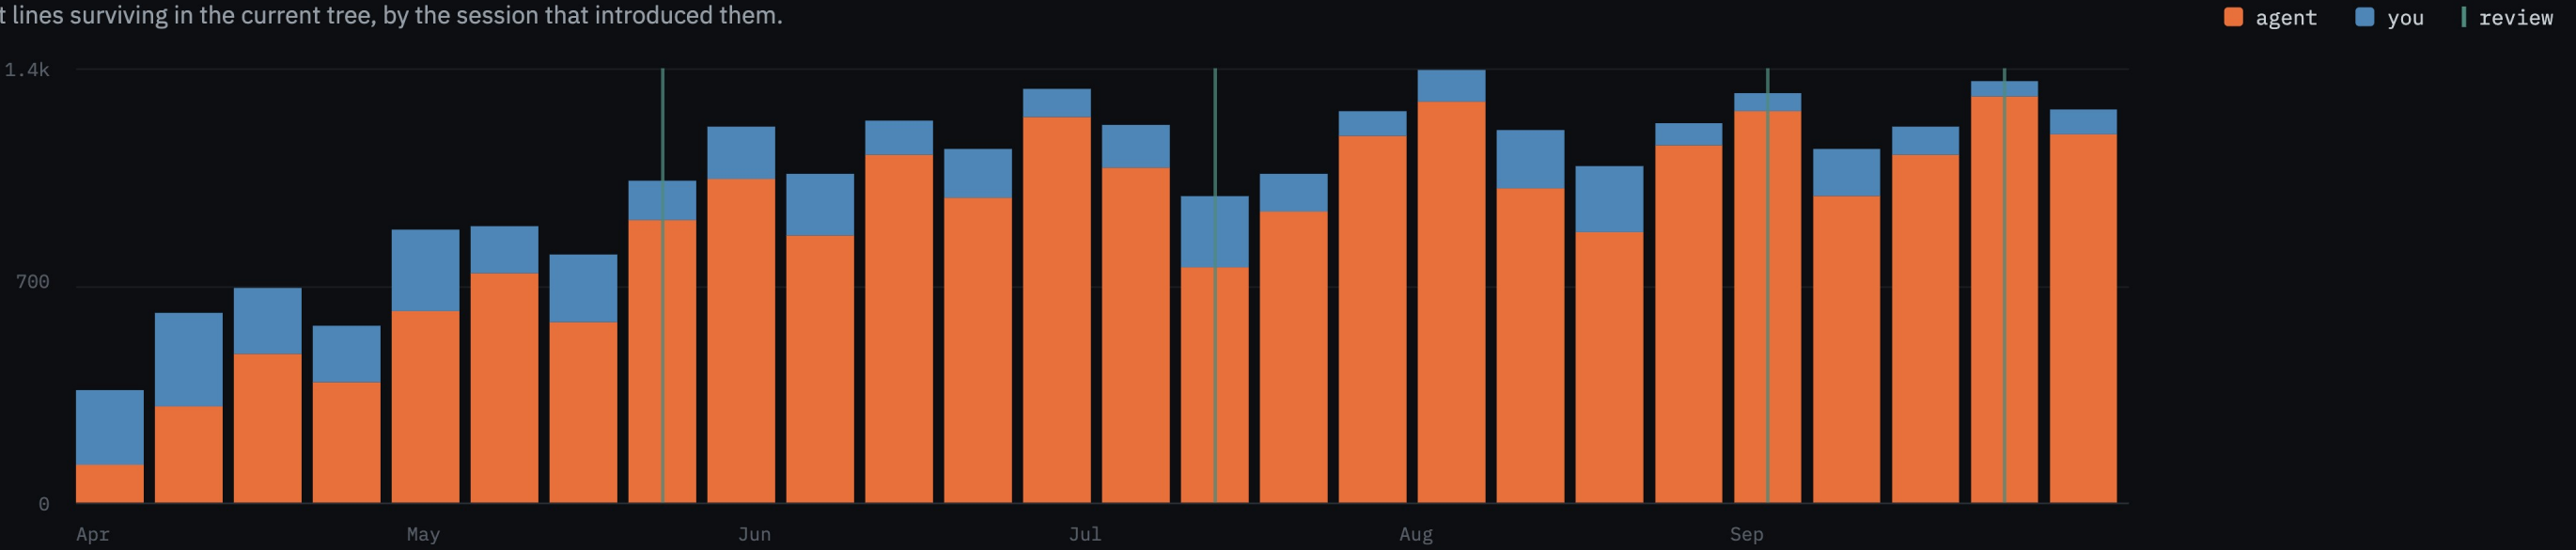

IBM Plex Sans · prose only, never data

RULES

- The state scale is the only place saturated color appears. Chrome is neutral so the data carries every signal.
- Mono for anything measured, sans for anything written. Never mix them inside one line.
- No success green and no error red anywhere, so the scale is never confused with build status.
- Hatching means never tested. Solid fill means a quiz result exists. The two are never blended into one number.
- The number states the fact and the UI never editorializes. No praise, no scolding, no streak nagging.

Who wrote this repo, over time

Net lines surviving in the current tree, by the session that introduced them.

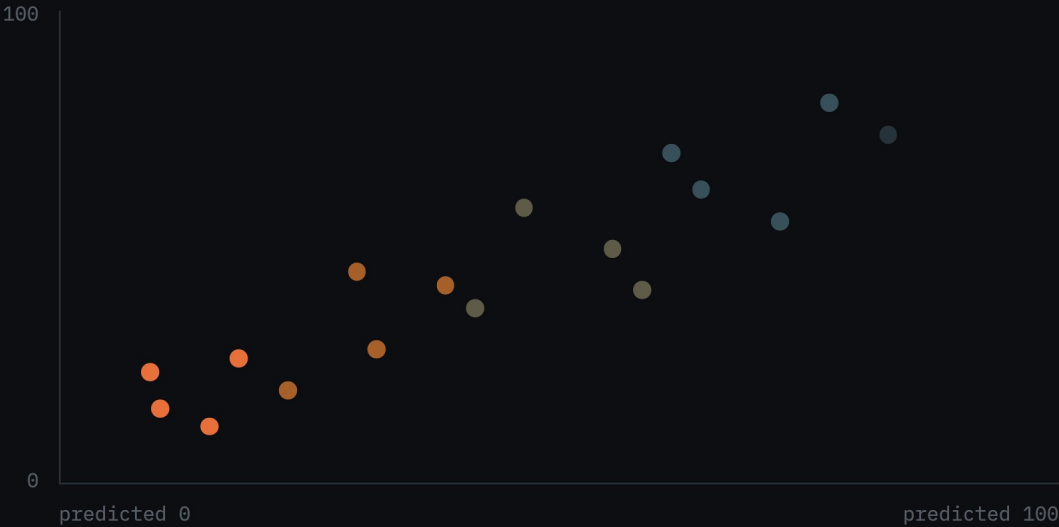

Per-file history

a lane with no blue is a file you have never touched by hand

Does the estimate hold up?

Predicted score against measured quiz accuracy. Points far below the line are files you thought you knew.

Confidence versus accuracy

How often you were right, grouped by how sure you said you were.

You were wrong on 4 of the 11 answers you marked solid. Those files were re-flagged.

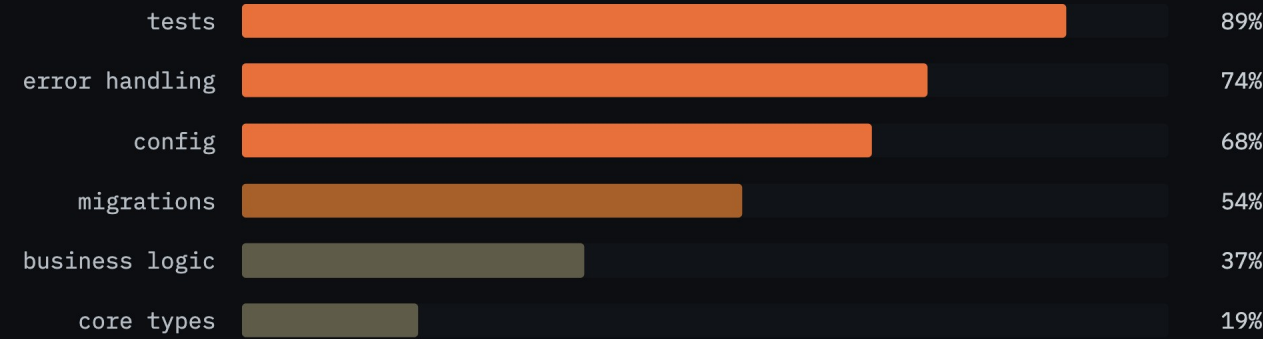

Comprehension over time

Repo score by week. It climbs when you review and decays when you don't.

What you delegate most

Share of lines that arrived with no engagement, by kind of file.

Tests and error handling are where delegation concentrates, which is also where failures stay quiet longest.
